Task: Identify and Fix the Layout Problems

Description:

This exercise uses a deliberately broken layout and you need to inspect the CSS and fix them.

What is wrong in the original CSS?

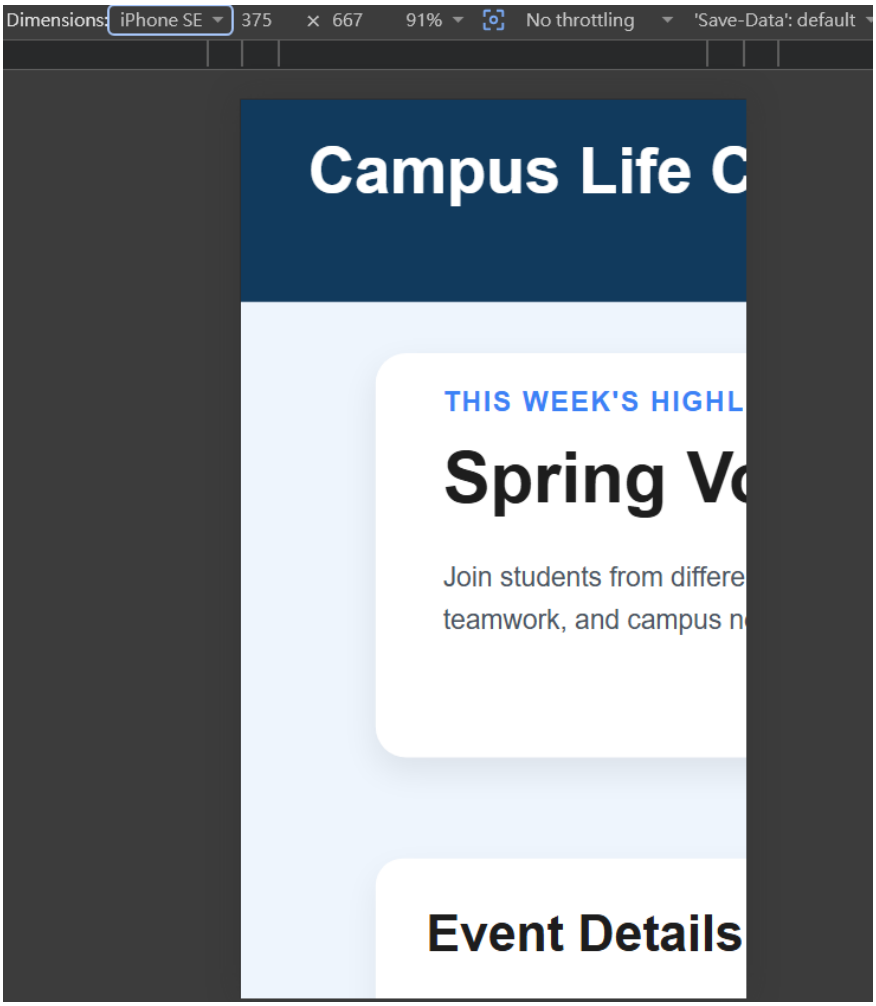

1. **Everything is positioned with `position: absolute`.**
    - This removes the normal document flow.
    - Elements overlap each other and are hard to maintain.
    - When the browser width changes, the layout does not adapt.

2. **Fixed widths and fixed heights are used everywhere.**
    - The page is locked to a 1200px container and large absolute coordinates.
    - On smaller screens, content may be cut off or pushed outside the viewport.

3. **The layout depends on manually guessed coordinates.**
    - The header, hero section, and cards are placed by exact pixels.
    - This is brittle and difficult to update later.

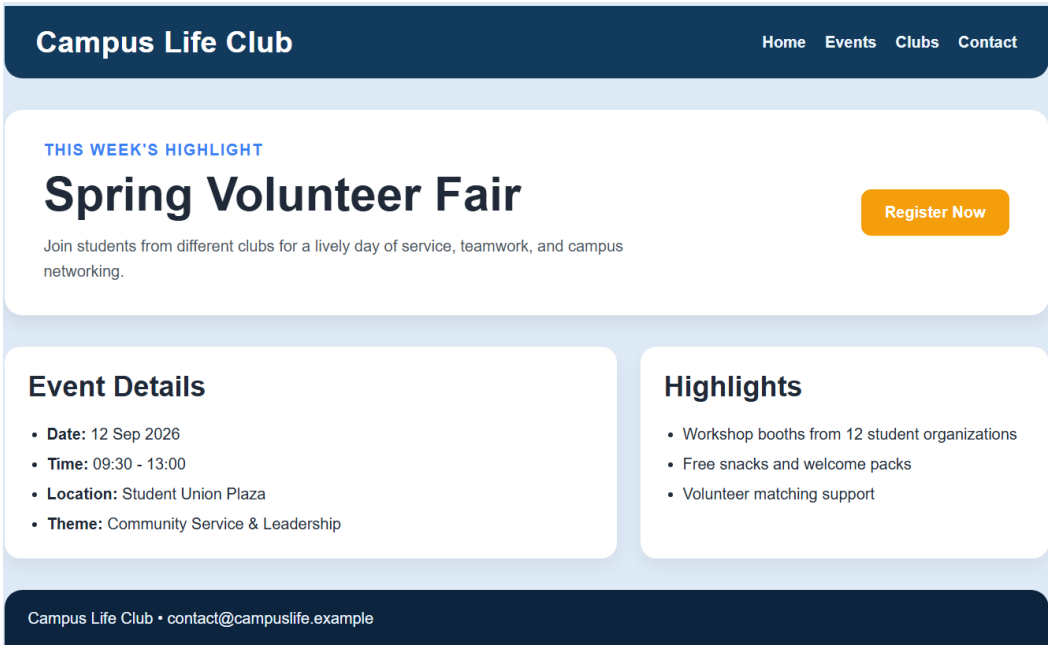

4. **The page is not responsive.**
    - There is no flexible layout for mobile devices or different viewport sizes.
    - A better solution uses normal flow, flexbox, or CSS Grid.

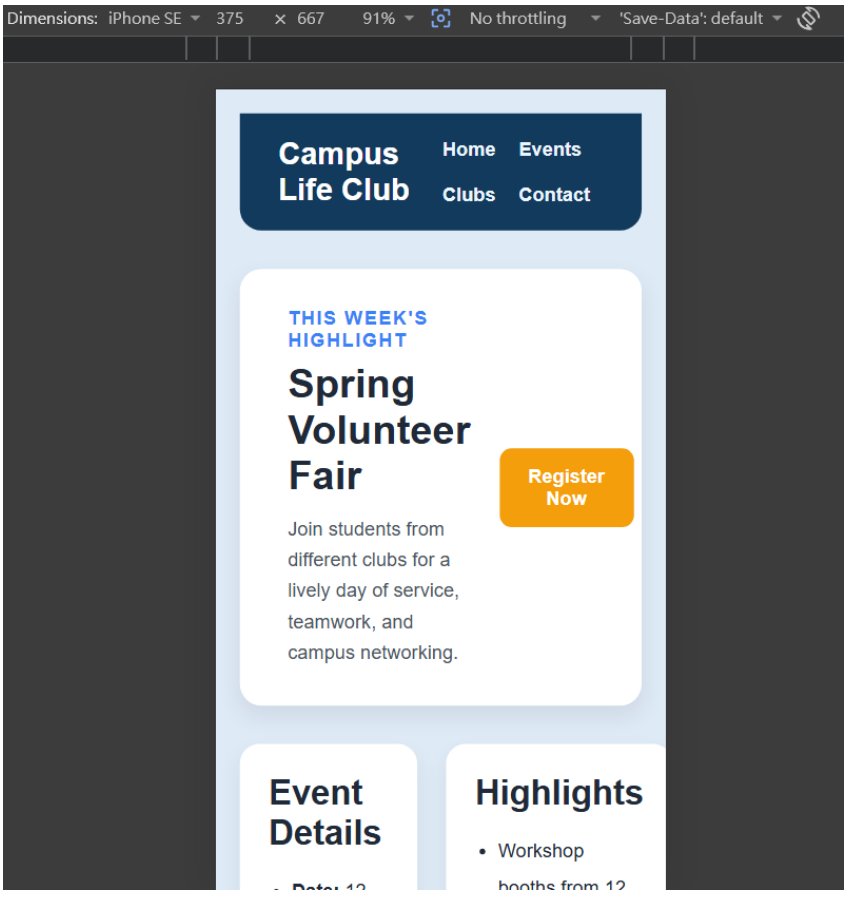

Desired and maintainable layout should be:

- keep elements in the normal document flow when possible;
- use flexbox or grid for alignment and spacing;
- rely on relative sizing such as `max-width`, `padding` and `gap` instead of fixed pixel placements;
- keep each section independent and easy to modify.
